

PROJECT SYNOPSIS: AgriVision AI

B.Tech CSE / AI-ML Major Capstone Project | Decision-Support System

Title: Reliable & Explainable Plant Disease Diagnosis and RAG Management System

Domain: Computer Vision, Deep Learning, Explainable AI (XAI), RAG / LLM Agronomy Decision Support

1. Executive Summary & Problem Statement

Plant diseases severely impact agricultural yield and food security. Existing deep learning classifiers suffer from black-box opacity, uncalibrated model overconfidence on out-of-distribution imagery, and generative AI hallucinations when offering chemical treatment advice. AgriVision AI addresses these gaps by combining ResNet50 classification, Grad-CAM visual explainability, an attention coverage heuristic, and a Retrieval-Augmented Generation (RAG) agronomy engine that grounds LLM guidance in certified pathology data.

2. Key Project Objectives

- Classify 38 PlantVillage crop-disease categories using fine-tuned ResNet50 Transfer Learning.
- Provide visual transparency via Grad-CAM heatmaps targeting layer conv5_block3_out.
- Formulate an Attention Coverage Heuristic with uncertainty safety thresholds (<60% confidence).
- Eliminate AI hallucinations using a 38-class RAG knowledge base for certified treatment & prevention.
- Deliver an accessible multimodal UI with voice recognition (English/Hindi) and PDF export.

3. System Architecture & Technical Stack

Pipeline Workflow:

- * Input Leaf Image (224x224 RGB)
- * ResNet50 CNN (GAP + Dense 256 + Softmax)
- * Grad-CAM Heatmap (conv5_block3_out)
- * Attention Coverage % & Uncertainty Guard
- * RAG Knowledge Retrieval (JSON DB)
- * LLM Decision Support (Qwen2.5 / Mistral-7B)
- * Streamlit Multimodal UI & Printable PDF

Technical Specifications:

Language & Core:	Python 3.11, TensorFlow 2.20, OpenCV
Model Backbone:	ResNet50 (Transfer Learning, 38 Classes)
Explainable AI:	Grad-CAM (Gradient-Weighted Class Activation)
RAG & LLM Engine:	Hugging Face Inference API (Qwen / Mistral)
Voice Interface:	Web Speech API, OpenAI Whisper, gTTS
Frontend & Report:	Streamlit 1.51.0, FPDF2 Engine

4. Key Functional Modules

CNN Classifier:	Loads ResNet50 architecture fine-tuned on 38 plant disease/healthy categories.
Grad-CAM XAI:	Computes neuron importance weights to generate focus heatmaps for diagnosis visual proof.
Attention Heuristic:	Calculates active pixel coverage and flags low-confidence (<60%) uncertain inputs.
RAG Engine:	Retrieves symptoms, chemical treatments, organic remedies, & prevention to ground LLMs.
Agri-Chatbot:	Supports voice (Hindi/English) and text follow-up questions for interactive crop assistance.
PDF Health Card:	Exports an official executive PDF diagnostic report for field extension use.

5. Expected Academic Outcomes & Field Impact

AgriVision AI bridges the gap between high-accuracy deep learning and practical agricultural deployment. By providing visual explanation heatmaps and evidence-grounded RAG advice, the system ensures zero chemical dosage hallucinations and empowers farmers with trustworthy decision support. Its academic framing as a decision-support system guarantees high defensibility for university viva examinations and research publication.
